Comp Theory Mind

#3 CCTM

↳ classical—

The mind is a computational system similar to a Turing Machine

w- necessary commitments

PROGRAMMABLE

Literally - not figuratively - like a TURING MACHINE

departures —

symbols in : symbols out

infinite memory

not random access

TM serial

determinism

3.1 machine functionalism

I think this is a good theory

much for category

probabilistic automata

automaton states ≈ mental states

the organization is the machine table

① Prob

finite—

② Systematicity

log behav

type identity

mental states are behavioral predispositions

mental states are brain states

3.2 - Representational Theory — propositional attitudes

Language of Thought —

Composition

addresses productivity and systematicity—

4.4 – Neural Networks

Computational Neuroscience

Biological realism —

brain data – knowledge

neural computation – what can neurons compute?

Theorizing about mental computation should start c the brain. not THIS.

No multi-realizability

5. Computation & Representation.

intentional realism. |

identifies mental states c their representations

ELIMINATIVISM

Formal & syntactic syntax not semantics

↳ semantically meaningful

c, can we elaborate if the brain is that way

does meaning do any work?

should we use the formal multi-realizable?

Externalism ~ our mental content is partly determined by stuff outside n. body

computation — internal divide

— 7. Arguments against computationalism

1. TRIVIAL
   - almost anything can be described as "computation"
   - over look constraints

Rebuttals
- implementation relation between comp model — physical system
- panconputationalism
  - incompleteness
  - limits
  - Fodor & abductive reasoning
    local v. non-local properties
    v relevance
    v simplicity

- temporal —
  nothing prevents the TM from having some notion of time.

- embodied cognition
